

Always be vigilant on a lake in winter

To venture safely on a frozen body of water, **there must be a good thickness of ice and no risk is to be taken.** According to the Quebec Lifesaving Society, ice must be **at least 10 cm thick** for walking, ice fishing, cross-country skiing or skating. Besides, you may know that the thickness of the ice is not the same throughout the lake. So, be extra careful.

We wish you a very Happy New Year 2023!
